

Dear Hiring Team at the Canadian Space Agency,

I am writing to express my strong enthusiasm for the Canadarm3 Program Systems Engineering Internship within the Space Exploration Directorate at the Canadian Space Agency (CSA) for the Winter 2027 term. As a Software Engineering Co-op student at McGill University with a rigorous foundation in object-oriented architecture, data modeling, requirements engineering, and multidisciplinary project execution, I am eager to contribute to Model-Based Systems Engineering (MBSE) and requirements management for Canada's next-generation smart space robotic system.

My software engineering training aligns directly with the core methodologies of modern systems engineering. In my coursework and applied software projects, I regularly design system architecture diagrams, define behavioral state machines, model complex interface relationships, and enforce strict requirements traceability. Through my work developing full-stack applications and managing containerized Linux server environments, I have built strong capabilities in structured data exchange, API interface modeling, and database schema alignment, skills essential for establishing seamless data interchange methodologies across international partners like NASA and industrial prime contractors.

Beyond core software design, my engineering work terms at the National Institute for Scientific Research (INRS) and the Ministry of Transportation (MTMD) sharpened my ability to analyze complex technical specifications, conduct rigorous verification checks, and author clear engineering documentation. Furthermore, having spent four years mentoring FIRST Robotics teams and holding leadership roles across student organizations, I thrive in multidisciplinary environments where precise communication, meticulous attention to detail, and self-directed problem-solving are required to align diverse engineering teams toward shared technical standards.

The opportunity to learn under senior CSA systems engineers and directly support MBSE modeling, requirement linkages, and verification architectures for the flagship Canadarm3 program is an extraordinary milestone. Whether modeling system behaviors, evaluating software tools, or verifying contractor deliverables, I bring a systematic, analytical, and highly organized approach to the team.

Thank you for your time and consideration. I welcome the opportunity to discuss how my systems modeling, software engineering, and analytical skills align with the goals of the Canadarm3 Program.

Sincerely,

Renji Jenkins
