

Dear Hiring Team at Genetec,

I am writing to express my strong enthusiasm for software development, systems, networking, and machine learning internship opportunities at Genetec. As a Software Engineering Co-op student at McGill University with hands-on experience spanning full-stack web platforms, network server infrastructure, and deep learning architectures, I am eager to contribute to Genetec's unified physical security ecosystem. Having attended Genetec's information session, I was particularly inspired by your culture of innovation and the specialized technical training courses offered to interns, making Genetec the ideal environment for my growth as a developer.

My technical foundation spans low-level systems programming, full-stack software development, and network engineering. I build performant applications using C++, Python, Java, C#, and JavaScript/React, grounded in object-oriented architecture and SQL database management. On the systems and networking front, I independently assemble and administer multi-bay Linux server infrastructure (Synology NAS), where I configure reverse proxies, manage SSL/TLS encryption certificates, set up local DNS/port forwarding, and maintain containerized services (Docker). This hands-on network administration background gives me a practical understanding of TCP/IP, client-server security protocols, and real-time data streaming essential for unified IP video surveillance and access control platforms.

In addition to core software development and networking, I bring applied AI and machine learning experience. I have engineered custom neural network architectures in Python (PyTorch, NumPy, scikit-learn) and am currently developing *FoodLens*, an end-to-end computer vision and NLP application that performs real-time image recognition to generate custom recipes. This project has honed my ability to handle dataset preprocessing, model training, computer vision pipelines, and API integrations. Furthermore, during my engineering work term at the National Institute for Scientific Research (INRS) and technical role at the Ministry of Transportation (MTMD), I engineered automated Python algorithms to process complex spatial datasets, conduct root-cause defect analysis, and optimize data workflows within Agile/Kanban environments.

Whether contributing to backend platform architecture, containerized microservices, security protocols, or intelligent video analytics, I thrive in fast-paced teams that value clean code, rigorous unit testing, and continuous learning.

Thank you for your time and consideration. I welcome the opportunity to discuss how my software engineering background, networking experience, and AI projects align with Genetec's development goals.

Sincerely,

Renji Jenkins
