

Dear Hiring Team,

I am writing to express my strong enthusiasm for the Machine Learning Intern position within Epic Games' Special Projects and Research Group. As a Software Engineering Co-op student at McGill University with hands-on experience designing neural networks from scratch, processing computer vision datasets, and writing performant C++ and Python code, I am eager to contribute to Epic's next-generation AI, developer tools, and interactive technologies.

My technical capabilities align directly with the intersection of machine learning development and software engineering. I have built custom neural networks in Python using standard ML libraries (PyTorch, NumPy, Tensorflow) and completed advanced coursework in deep learning architectures. To put theory into practice, I am currently engineering an end-to-end computer vision and NLP application that performs real-time food image recognition to generate custom recipes, giving me practical experience in model prototyping, dataset preprocessing, and model experimentation.

This applied ML background is reinforced by my research work at the National Institute for Scientific Research (INRS), where I engineered automated Python algorithms to extract pattern intelligence from complex geospatial and satellite imagery datasets. Combined with my systems-level C++ programming skills and hands-on Linux administration, I bring a solid foundation in algorithm optimization, clean object-oriented architecture, and data pipelines.

Having completed prior engineering work terms in government and research settings, I thrive in fast-paced environments where proactive problem-solving, rapid iteration, and technical precision are paramount. Epic's mission to redefine interactive entertainment and empower creators through real-time tools makes this role an ideal fit for my technical drive.

Thank you for your time and consideration. I welcome the opportunity to discuss how my neural network development, computer vision projects, and engineering experience align with your team's research goals.

Sincerely,

Renji Jenkins
