

Dear Hiring Team,

I am writing to express my strong enthusiasm for the Optical Test Automation Co-op at Nokia. As a Software Engineering Co-op student at McGill University with a strong foundation in deep learning, algorithm design, and software development, I am eager to contribute to Nokia's ongoing innovation in intelligent systems.

To complement my academic studies at McGill, I have actively expanded my theoretical and practical machine learning knowledge through specialized Coursera courses focused on neural networks and deep learning. I regularly apply these principles to real-world software development: I have built custom neural networks from scratch in Python and am currently developing an end-to-end computer vision and NLP side project that performs real-time food recognition from images to generate custom recipes.

This practical machine learning foundation is further supported by my research work at the National Institute for Scientific Research (INRS), where I engineered Python algorithms to process satellite imagery and extract pattern intelligence from complex geospatial datasets. My technical stack spanning Python, C++, C#, and relational database management allows me to efficiently bridge the gap between theoretical AI models and clean, production-ready code.

In addition to my technical capabilities, my experience leading multidisciplinary initiatives, such as founding an academic competition committee, has refined my problem-solving skills, adaptability, and ability to communicate complex concepts clearly. I thrive in dynamic, fast-paced environments where innovation and rigor intersect.

Nokia's leadership in deploying cutting-edge AI technologies across next-generation communication networks makes this opportunity deeply inspiring to me. I welcome the opportunity to discuss how my neural network expertise, self-directed learning, and research experience can bring value to your team.

Thank you for your time and consideration.

Sincerely,

Renji Jenkins
